## (57) Abstract.

**PURPOSE:** A pneumatic suspension is provided to switch with an on-off method, containing a compressor needing to be intermittently operated having a long stop during the normal operation of the air suspension.

**CONSTITUTION:** A pneumatic suspension is installed with the steps of calculating the action temperature presumptive value of a compressor(1); turning switch-off the compressor if the presumed value is over a critical value of the upper side, turning switch-on the compressor or including a computer capable of turning switch-on the compressor if the presumed value passes through under the critical value of the lower side, and switching the compressor with the on-off method by a control unit(3).
